

Estructura de Datos y algoritmos 1

Tema 5 - Estructuras de datos NO ordenadas

Arraylist $\langle T \rangle$

LinkedList $\langle T \rangle$

Busca index $\langle T, aux \rangle$

↳ pos

ED ASOCIADAS

TreeSet $\langle T \rangle$

HashSet $\langle T \rangle$

↳ NO TIENE MÉTODO BÚSCA

TreeMap $\langle T \rangle$

HashMap $\langle K, V \rangle$

Biggest \rightarrow (base)

Biggest referencia a valor

getKey (base)

TreeMap $\langle \text{Estudiante}, \text{estudiantes} \rangle$

aux

Objeto completo

Cosas de java

HashMap $\langle \text{Node}, \text{HashSet} \langle \text{Node} \rangle \rangle \rightarrow$ Grupos NO ordenados (N:M)

Node encapsula un arraylist genérico de tipo T $T \equiv \text{Persona}$

CLAVE NOMBRE (STRING)

Dominio de aplicación \rightarrow Red Social por ejemplo.

Ejercicio de examen

Se quiere convertir en: Converter()

TreeMap < K₁ String, TreeMap < K₂ String, ArrayList < K₃ Integer >>>

TreeMap < K₄ String, TreeMap < K₅ String, TreeMap < K₆ String, Integer >>>
V₆

Teniendo en cuenta la representación gráfica de la estructura Original y la estructura Destino, vamos a clonar la estructura origen en la estructura destino.

$$K_1 = K_4$$

$$K_2 = K_5$$

$$V_6 = \text{frecuencia}(K_3)$$

```

TreeMap < String, TreeMap < String, ArrayList < String >>> dots;

public TreeMap < String, TreeMap < String, ArrayList < String, Integer >>> converter() {
    private TreeMap < String, TreeMap < String, TreeMap < String, Integer >>> result;

    for (Entry < String, TreeMap < String, ArrayList < String >> entry : this.dots.entrySet()) {
        TreeMap < String, TreeMap < String, Integer >>> aux2 = new TreeMap <>();

        for (Entry < String, ArrayList < String >> entry2 : entry.getValue().entrySet()) {
            TreeMap < String, Integer > aux = new TreeMap <>();

            for (String probab : entry2.getValue()) {
                Integer value = aux.get(probab);
                aux.put(probab, value == null ? 1 : value + 1);
            }

            aux.put(entry2.getKey(), aux);
        }

        result.put(entry.getKey(), aux2);
    }

    return result;
}

```

TreeMap <String, TreeMap <String, TreeMap <String, Integer>>> destino;

AVLTree <Par <String, AVLTree <Par <String, AVLTree <Par <String, Integer>>>>> origen;

public void convertir() {

TreeMap <String, TreeMap <String, Integer>> aux;

for (Par <String, AVLTree <Par <String, AVLTree <Par <String, Integer>>>>> parMap :
destino) {

destino.put (parMap.getKey(), aux = new TreeMap <>());

TreeMap <String, Integer> aux;

for (Par <String, AVLTree <Par <String, Integer>>> parSecond : parMap.getValue()) {

aux.put (parSecond.getKey(), aux2 = new TreeMap <>());

for (Par <String, Integer> parThird : parSecond.getValue()) {

aux2.put (parThird.getKey(), parThird.getValue());

}

}

}

}
